

## **ABSTRACT OF THE DISCLOSURE**

A hitch assembly for coupling a trailer to a tow vehicle includes a number of assemblies, including converging links and a slide assembly, that effectively places the pivot point for the trailer ahead of the actual hitch assembly, which in turn enhances the stability of the combination tow vehicle and trailer, rendering it less susceptible to swaying or fishtailing. This is done without placing tongue weight on converging links or the slide assembly so that the hitch assembly can accommodate a larger gross trailer load.
